

HOMOLOGICAL PROPERTIES OF BIGRADED ALGEBRAS

TIM RÖMER

ABSTRACT. We study the x - and y -regularity of a bigraded K -algebra R as introduced in [2]. These notions are used to study asymptotic properties of certain finitely generated bigraded modules. As an application we get for any equigenerated graded ideal I upper bounds for the number j_0 for which $\text{reg}(I^j)$ is a linear function for $j \geq j_0$. Finally we give upper bounds for the x - and y -regularity of generalized Veronese algebras.

INTRODUCTION

Let $S = K[x_1, \dots, x_n, y_1, \dots, y_m]$ be a standard bigraded polynomial ring with $\deg(x_i) = (1, 0)$ and $\deg(y_j) = (0, 1)$, and let $J \subset S$ be a bigraded ideal. In this paper we study homological properties of the bigraded algebra $R = S/J$.

First we consider the x - and the y -regularity of R . According to [2] they are defined as follows:

$$\text{reg}_x^S(R) = \max\{a: \beta_{i,(a+i,b)}^S(R) \neq 0 \text{ for some } i \text{ and } b\},$$

$$\text{reg}_y^S(R) = \max\{b: \beta_{i,(a,b+i)}^S(R) \neq 0 \text{ for some } i \text{ and } a\},$$

where $\beta_{i,(a,b)}^S(R) = \dim_K \text{Tor}_i^S(K, R)_{(a,b)}$ is the i^{th} bigraded Betti number of R in bidegree (a, b) . We give a homological characterization of these regularities similarly as in the graded case (see [3]). As an application we generalize a result of Trung [13] concerning d -sequences. Furthermore we prove that

$$\text{reg}_x^S(S/J) = \text{reg}_x^S(S/\text{bigin}(J)),$$

where $\text{bigin}(J)$ is the bigeneric initial ideal of J with respect to the bigraded reverse lexicographic order induced by $y_1 > \dots > y_m > x_1 > \dots > x_n$.

It was shown in [7] (or [12]) that for $j \gg 0$, $\text{reg}(I^j)$ is a linear function $cj + d$ in j for a graded ideal I in the polynomial ring. In [12] the constant c is described in terms of invariants of I . In this paper we give, in case I is equigenerated, bounds j_0 such that for $j \geq j_0$ the function is linear and give also a bound for d . Our methods can also be applied to $\text{reg}(S^j(I))$, where $S^j(I)$ is the j^{th} symmetric power of I .

In the last section we introduce a generalized Veronese algebra in the bigraded setting. For a bigraded algebra R and $\hat{\Delta} = (s, t)$ we set

$$R_{\hat{\Delta}} = \bigoplus_{(a,b) \in \mathbb{N}^2} R_{(as, bt)}.$$

In the same manner as it is done for diagonal subalgebras in [6], we prove that for these algebras

$$\operatorname{reg}_x^{S_{\hat{\Delta}}}(R_{\hat{\Delta}}) = 0 \text{ and } \operatorname{reg}_y^{S_{\hat{\Delta}}}(R_{\hat{\Delta}}) = 0, \text{ if } s \gg 0 \text{ and } t \gg 0.$$

1. PRELIMINARIES

Throughout this paper, let K be an infinite field, let $S = K[x_1, \dots, x_n, y_1, \dots, y_m]$ be a standard bigraded polynomial ring with $\deg(x_i) = (1, 0)$ and $\deg(y_j) = (0, 1)$. Let M be a finitely generated bigraded S -module. For some bihomogeneous $w \in M$ with $\deg(w) = (a, b)$ we set $\deg_x(w) = a$ and $\deg_y(w) = b$. Sometimes we will consider the \mathbb{Z} -graded modules $M_{(a,*)} = \bigoplus_b M_{(a,b)}$ or $M_{(*,b)} = \bigoplus_a M_{(a,b)}$. If in addition M is $\mathbb{N}^n \times \mathbb{N}^m$ -graded, we write $M_{(u,v)}$ for the homogeneous component (u, v) , where $u \in \mathbb{N}^n$ and $v \in \mathbb{N}^m$. For $u \in \mathbb{N}^n$ we set $\operatorname{supp}(u) = \{i: u_i > 0\}$.

Define $\mathbf{m}_x = (x_1, \dots, x_n) = (\mathbf{x})$, $\mathbf{m}_y = (y_1, \dots, y_m) = (\mathbf{y})$ and $\mathbf{m} = \mathbf{m}_x + \mathbf{m}_y$. Let $S_x = K[x_1, \dots, x_n]$ and $S_y = K[y_1, \dots, y_m]$ be the polynomial rings with respect to the x -variables and the y -variables respectively.

For some $u = (u_1, \dots, u_n) \in \mathbb{N}^n$ and $v = (v_1, \dots, v_m) \in \mathbb{N}^m$ we write $x^u y^v$ for the monomial $x_1^{u_1} \dots x_n^{u_n} y_1^{v_1} \dots y_m^{v_m}$. For $u, u' \in \mathbb{N}^n$ let $u \preceq u'$, if $u_i \leq u'_i$ for all i . Furthermore we set $|u| = u_1 + \dots + u_n$. Let $\varepsilon_i = (0, \dots, 0, 1, 0, \dots, 0) \in \mathbb{N}^n$, where the entry 1 is at the i^{th} position. For $t \in \mathbb{N}$ define $[t] = \{1, \dots, t\}$.

We will consider bigraded algebras $R = S/J$, which are quotients of S by some bigraded ideal J . For a finitely generated bigraded R -module M and $a, b \in \mathbb{N}$ let $\beta_{i,(a,b)}^R(M) = \dim_K \operatorname{Tor}_i^R(M, K)_{(a,b)}$ the i^{th} bigraded Betti number in bidegree (a, b) . We recall from [2] that

$$\operatorname{reg}_x^R(M) = \sup\{a: \beta_{i,(a+i,b)}^R(M) \neq 0 \text{ for some } i \text{ and } b\},$$

$$\operatorname{reg}_y^R(M) = \sup\{b: \beta_{i,(a,b+i)}^R(M) \neq 0 \text{ for some } i \text{ and } a\},$$

is the x - and y -regularity of M . For $R = S$ we set $\operatorname{reg}_x^S(M) = \operatorname{reg}_x(M)$ and $\operatorname{reg}_y^S(M) = \operatorname{reg}_y(M)$.

Let $K_\bullet(k, l; M)$ denote the Koszul complex of M and $H_\bullet(k, l; M)$ denote the Koszul homology of M with respect to x_1, \dots, x_k and y_1, \dots, y_l (see [5] for details). If it is clear from the context, we will write $K_\bullet(k, l)$ and $H_\bullet(k, l)$ instead of $K_\bullet(k, l; M)$ and $H_\bullet(k, l; M)$. Note that $K_\bullet(k, l; M) = K_\bullet(k, l; S) \otimes_S M$, where $K_\bullet(k, l; S)$ is the exterior algebra on e_1, \dots, e_k and f_1, \dots, f_l with $\deg(e_i) = (1, 0)$ and $\deg(f_j) = (0, 1)$ together with a differential ∂ induced by $\partial(e_i) = x_i$ and $\partial(f_j) = y_j$. For a cycle $z \in K_\bullet(k, l; M)$ we denote by $[z] \in H_\bullet(k, l; M)$ the corresponding homology class.

There are two long exact sequences relating the homology groups:

$$\dots \rightarrow H_i(k, l; M)(-1, 0) \xrightarrow{x_{k+1}} H_i(k, l; M) \rightarrow H_i(k+1, l; M) \rightarrow H_{i-1}(k, l; M)(-1, 0)$$

$$\xrightarrow{x_{k+1}} \dots \rightarrow H_0(k, l; M)(-1, 0) \xrightarrow{x_{k+1}} H_0(k, l; M) \rightarrow H_0(k+1, l; M) \rightarrow 0$$

and

$$\dots \rightarrow H_i(k, l; M)(0, -1) \xrightarrow{y_{l+1}} H_i(k, l; M) \rightarrow H_i(k, l+1; M) \rightarrow H_{i-1}(k, l; M)(0, -1)$$

$$\xrightarrow{y_{l+1}} \dots \rightarrow H_0(k, l; M)(0, -1) \xrightarrow{y_{l+1}} H_0(k, l; M) \rightarrow H_0(k, l+1; M) \rightarrow 0.$$

The map $H_i(k, l; M) \rightarrow H_i(k+1, l; M)$ is induced by the inclusion of the corresponding Koszul complexes. Every homogeneous element $z \in K_*(k+1, l; M)$ can be uniquely written as $e_{k+1} \wedge z' + z''$ with $z', z'' \in K_*(k, l; M)$. Then $H_i(k+1, l; M) \rightarrow H_{i-1}(k, l; M)(-1, 0)$ is given by sending a cycle $[z]$ to $[z']$. Furthermore $H_i(k, l; M)(-1, 0) \xrightarrow{x_{k+1}} H_i(k, l; M)$ is just the multiplication with x_{k+1} . The maps in the other exact sequence are analogue.

2. REGULARITY

Let R be a bigraded algebra. Following [3] (or [13] under the name filter regular element) we call an element $x \in R_{(1,0)}$ an almost regular element for R (with respect to the x -degree), if

$$(0 :_R x)_{(a,*)} = 0 \text{ for } a \gg 0.$$

A sequence $x_1, \dots, x_t \in R_{(1,0)}$ is an almost regular sequence (with respect to the x -degree), if for all $i \in [t]$ the x_i is almost regular for $R/(x_1, \dots, x_{i-1})R$.

Analogue we call an element $y \in R_{(0,1)}$ an almost regular element for R (with respect to the y -degree), if

$$(0 :_R y)_{(*,b)} = 0 \text{ for } b \gg 0.$$

A sequence $y_1, \dots, y_t \in R_{(0,1)}$ is an almost regular sequence (with respect to the y -degree), if for all $i \in [t]$ the y_i is almost regular for $R/(y_1, \dots, y_{i-1})R$.

It is well known that, provided $|K| = \infty$, after a generic choice of coordinates we can achieve that \mathbf{x} and \mathbf{y} are almost regular for R with respect to the x - and y -degree. For the convenience of the reader we give a proof of this fact, which follows from the following lemma (see also [13]).

Lemma 2.1. *Let R be a bigraded algebra, then there exists $x \in R_{(1,0)}$ ($y \in R_{(0,1)}$) which is almost regular for R .*

Proof. By symmetry it is enough to prove the statement for x . We claim that it is possible to choose $0 \neq x \in R_{(1,0)}$ such that for all $Q \in \text{Ass}_S(0 :_R x)$ one has $Q \supseteq \mathfrak{m}_x$. It follows that $\text{Rad}_S(\text{Ann}_S(0 :_R x)) \supseteq \mathfrak{m}_x$. Hence there exists an integer i with $\mathfrak{m}_x^i(0 :_R x) = 0$ and this proves the lemma.

It remains to show the claim. If $P \supseteq \mathfrak{m}_x$ for all $P \in \text{Ass}_S(R)$, then we may choose $0 \neq x \in R_{(1,0)}$ arbitrarily, because $\text{Ass}_S(0 :_R x) \subseteq \text{Ass}_S(R)$. Otherwise there exists a $P \in \text{Ass}_S(R)$ with $P \not\supseteq \mathfrak{m}_x$. In this case we may choose

$$x \notin \bigcup_{P \in \text{Ass}_S(R), P \not\supseteq \mathfrak{m}_x} P,$$

since $|K| = \infty$. Let $Q \in \text{Ass}_S(0 :_R x)$ be arbitrary. Then $x \in Q$, because $x \in \text{Ann}_S(0 :_R x)$. But we have also that $Q \in \text{Ass}_S(R)$ and this implies that $Q \supseteq \mathfrak{m}_x$, by the choice of x . This proves the claim. \square

Let \mathbf{x} and \mathbf{y} be almost regular for R with respect to the x - and y -degree. Define

$$s_i^x = \max\{a : (0 :_{R/(x_1, \dots, x_{i-1})R} x_i)_{(a,*)} \neq 0\}, \quad s^x = \max\{s_1^x, \dots, s_n^x\}$$

and

$$s_i^y = \max\{b: (0 :_{R/(y_1, \dots, y_{i-1})R} y_i)_{(*,b)} \neq 0\}, \quad s^y = \max\{s_1^y, \dots, s_m^y\}.$$

The following theorem characterizes the x - and y -regularity. It is the analogue of the corresponding graded version [3].

For its proof we consider $\tilde{H}_0(k-1, 0) = (0 :_{R/(x_1, \dots, x_{k-1})R} x_k)$ for $k \in [n]$ and $\tilde{H}_0(n, k-1) = (0 :_{R/(y_1, \dots, y_{k-1})R} y_k)$ for $k \in [m]$. Then the beginning of the long exact Koszul sequence of the Koszul homology groups of R for $k \in [n]$ is

$$\dots \rightarrow H_1(k-1, 0)(-1, 0) \xrightarrow{x_k} H_1(k-1, 0) \rightarrow H_1(k, 0) \rightarrow \tilde{H}_0(k-1, 0)(-1, 0) \rightarrow 0,$$

and for $k \in [m]$

$$\dots \rightarrow H_1(n, k-1)(0, -1) \xrightarrow{y_k} H_1(n, k-1) \rightarrow H_1(n, k) \rightarrow \tilde{H}_0(n, k-1)(0, -1) \rightarrow 0.$$

Note that for $k \in [n]$ and $i \geq 1$ one has $H_i(k, 0)_{(a,*)} = 0$ for $a \gg 0$. Similar for $k \in [m]$ and $i \geq 1$ one has $H_i(n, k)_{(*,b)} = 0$ for $b \gg 0$.

Theorem 2.2. *Let R be a bigraded algebra, \mathbf{x} and \mathbf{y} almost regular for R with respect to the x - and y -degree, then*

$$\text{reg}_x(R) = s^x \text{ and } \text{reg}_y(R) = s^y.$$

Proof. By symmetry it is enough to show this theorem only for \mathbf{x} . Let

$$r_{(k,0)} = \max\{a: H_i(k, 0)_{(a+i,*)} \neq 0, i = 1, \dots, k\}$$

for $k \in [n]$ and

$$r_{(n,k)} = \max\{a: H_i(n, k)_{(a+i,*)} \neq 0, i = 1, \dots, n+k\}$$

for $k \in [m]$. Then $r_{(n,m)} = \text{reg}_x(R)$, because $H_0(n, m) = K$. We claim that:

- (i) For $k \in [n]$ one has $r_{(k,0)} = \max\{s_1^x, \dots, s_k^x\}$.
- (ii) For $k \in [m]$ one has $r_{(n,k)} = \max\{s_1^x, \dots, s_n^x\}$.

This will prove the theorem. We show (i) by induction on k . For $k = 1$ we have the following exact sequence

$$0 \rightarrow H_1(1, 0) \rightarrow \tilde{H}_0(0, 0)(-1, 0) \rightarrow 0$$

which proves this case. Let $k > 1$. Since

$$\dots \rightarrow H_1(k, 0) \rightarrow \tilde{H}_0(k-1, 0)(-1, 0) \rightarrow 0,$$

we get $r_{(k,0)} \geq s_k^x$. There exists an integer i with $H_i(k-1, 0)_{(r_{(k-1,0)}+i,*)} \neq 0$. Then by

$$\begin{aligned} \dots \rightarrow H_{i+1}(k, 0)_{(r_{(k-1,0)}+i+1,*)} &\rightarrow H_i(k-1, 0)_{(r_{(k-1,0)}+i,*)} \\ &\rightarrow H_i(k-1, 0)_{(r_{(k-1,0)}+i+1,*)} \rightarrow \dots \end{aligned}$$

we have $H_{i+1}(k, 0)_{(r_{(k-1,0)}+i+1,*)} \neq 0$, because $H_i(k-1, 0)_{(r_{(k-1,0)}+i+1,*)} = 0$. This gives $r_{(k,0)} \geq r_{(k-1,0)}$. On the other hand let $a > \max\{r_{(k-1,0)}, s_k^x\}$. If $i \geq 2$, then by

$$\dots \rightarrow H_i(k-1, 0)_{(a+i,*)} \rightarrow H_i(k, 0)_{(a+i,*)} \rightarrow H_{i-1}(k-1, 0)_{(a+i-1,*)} \rightarrow \dots$$

we get $H_i(k, 0)_{(a+i,*)} = 0$, because $H_i(k-1, 0)_{(a+i,*)} = H_{i-1}(k-1, 0)_{(a+i-1,*)} = 0$. Similarly $H_1(k, 0)_{(a+1,*)} = 0$. Therefore $r_{(k,0)} = \max\{r_{(k-1,0)}, s_k^x\} = \max\{s_1^x, \dots, s_k^x\}$, by the induction hypothesis.

We prove (ii) also by induction on k , $0 \leq k \leq m$. The case $k = 0$ was shown in (i), so let $k > 0$. Consider $a > s^x$. For $i \geq 2$ one has

$$\dots \rightarrow H_i(n, k-1)_{(a+i,*)} \rightarrow H_i(n, k)_{(a+i,*)} \rightarrow H_{i-1}(n, k-1)_{(a+i,*)} \rightarrow \dots$$

Then we get $H_i(n, k)_{(a+i,*)} = 0$, because $H_i(n, k-1)_{(a+i,*)} = H_{i-1}(n, k-1)_{(a+i,*)} = 0$. Similarly $H_1(n, k)_{(a+1,*)} = 0$ and therefore $r_{(n,k)} \leq s^x$.

There exists an integer i with $H_i(n, k-1)_{(s^x+i,*)} \neq 0$. Consider

$$\dots \rightarrow H_i(n, k-1)_{(s^x+i,*)} \xrightarrow{y_k} H_i(n, k-1)_{(s^x+i,*)} \rightarrow H_i(n, k)_{(s^x+i,*)} \rightarrow \dots$$

Assume $H_i(n, k)_{(s^x+i,*)} = 0$. But then $H_i(n, k-1)_{(s^x+i,*)} = y_k H_i(n, k-1)_{(s^x+i,*)}$, which is a contradiction by Nakayamas lemma, because $H_i(n, k-1)_{(s^x+i,*)}$ is a finitely generated module over S_y . Therefore $H_i(n, k)_{(s^x+i,*)} \neq 0$, and this proves the theorem. \square

3. d -SEQUENCES AND s -SEQUENCES

The concept of a d -sequence was introduced by Huneke [11]. Recall that a sequence of elements f_1, \dots, f_r in a ring R is called a d -sequence, if

- (i) f_1, \dots, f_r is a minimal system of generators of the ideal $I = (f_1, \dots, f_r)$,
- (ii) $(f_1, \dots, f_{i-1}) : f_i \cap I = (f_1, \dots, f_{i-1})$.

A result in [13] motivated the following theorem. For a bigraded algebra R denote by n_x and n_y the ideals generated by the $(1, 0)$ -forms and $(0, 1)$ -forms of R respectively.

Proposition 3.1. *Let R be a bigraded algebra, then*

- (i) $\text{reg}_x(R) = 0$ if and only if any generic minimal system of generators of $(1, 0)$ -forms for n_x is a d -sequence.
- (ii) $\text{reg}_y(R) = 0$ if and only if any generic minimal system of generators of $(0, 1)$ -forms for n_y is a d -sequence.

Proof. By symmetry we have only to prove (i). Without loss of generality $\mathbf{x} = x_1, \dots, x_n$ is an almost regular sequence for R with respect to the x -degree, because any generic minimal system of generators of $(1, 0)$ -forms for n_x has this property.

By 2.2 one has $\text{reg}_x(R) = 0$ if and only if $s^x = 0$. By definition of s^x , this is equivalent to the fact that for all $i \in [n]$ and all $a > 0$ we have

$$\left(\frac{(x_1, \dots, x_{i-1}) :_R x_i}{(x_1, \dots, x_{i-1})} \right)_{(a,*)} = 0.$$

Equivalently, for all $i \in [n]$,

$$(x_1, \dots, x_{i-1}) :_R x_i \cap n_x = (x_1, \dots, x_{i-1}).$$

This concludes the proof. \square

For an application we recall some more definitions. Let $I = (f_1, \dots, f_m) \subset S_x$ be a graded ideal generated in degree d . Denote with $R(I)$ and with $S(I)$ the Rees algebra

and the symmetric algebra of I respectively. It is well known that both algebras are bigraded and have a presentation S/J . For example $R(I) = S_x[It] \subset S_x[t]$. Define

$$\varphi : S \rightarrow R(I), \quad x_i \mapsto x_i, \quad y_j \mapsto f_j t,$$

and let $J = \text{Ker}(\varphi)$. With the assumption that I is generated in one degree we have that J is a bigraded ideal. Then we will always assume that $R(I) = S/J$. Note that then $I^j \cong (S/J)_{(*,j)}(-jd)$ for all j . Similarly we may assume that $S(I) = S/J$ for a bigraded ideal J . We also consider the finitely generated S_x -module $S^j(I) = (S/J)_{(*,j)}(-jd)$, which we call the j^{th} symbolic power of I .

For the notion of an s -sequence see [10]. The following results were shown in [10] and [13].

Corollary 3.2. *Let $I = (f_1, \dots, f_m) \subset S_x$ be a graded ideal generated in degree d . Then*

- (i) *I can be generated by an s -sequence (with respect to the reverse lexicographic order) if and only if $\text{reg}_y(S(I)) = 0$.*
- (ii) *I can be generated by a d -sequence if and only if $\text{reg}_y(R(I)) = 0$.*

Proof. In [10] and [13] it was shown that

- (i) I can be generated by an s -sequence (with respect to the reverse lexicographic order) if and only if $n_y \subseteq S(I)$ can be generated by a d -sequence.
- (ii) I can be generated by a d -sequence if and only if $n_y \subseteq R(I)$ can be generated by a d -sequence.

These facts together with 3.1 conclude the proof. \square

4. BIGENERIC INITIAL IDEALS

We recall the following definitions from [2]. For a monomial $x^u y^v \in S$ we set

$$\begin{aligned} m_x(x^u y^v) &= m(u) = \max\{0, i \text{ with } u_i > 0\}, \\ m_y(x^u y^v) &= m(v) = \max\{0, i \text{ with } v_i > 0\}. \end{aligned}$$

Similarly we define for $L \subseteq [n]$,

$$m(L) = \max\{0, i \text{ with } i \in L\}.$$

Let $J \subset S$ be a monomial ideal. We denote by $G(J)$ the unique minimal system of generators. If $G(J) = \{z_1, \dots, z_t\}$ with $\deg(z_i) = (u_i, v_i)$, then we set $m_x(J) = \max\{|u_i|\}$ and $m_y(J) = \max\{|v_i|\}$.

J is called *bistable* if for all monomials $z \in J$, all $i \leq m_x(z)$, all $j \leq m_y(z)$ one has $x_i z / x_{m_x(z)} \in J$ and $y_j z / y_{m_y(z)} \in J$.

J is called *strongly bistable* if for all monomials $z \in J$, all $i \leq s$ with x_s divides z , all $j \leq t$ with y_t divides z one has $x_i z / x_s \in J$ and $y_j z / y_t \in J$.

Lemma 4.1. *Let $J \subseteq S$ be a bistable ideal and $R = S/J$. Then*

- (i) x_n, \dots, x_1 is an almost regular sequence for R with respect to the x -degree.
- (ii) y_m, \dots, y_1 is an almost regular sequence for R with respect to the y -degree.

Proof. This follows easily from the fact that J is bistable. \square

We fix a term order $>$ on S by defining $x^u y^v > x^{u'} y^{v'}$ if either $(|u| + |v|, |v|, |u|) > (|u'| + |v'|, |v'|, |u'|)$ lexicographically or $(|u| + |v|, |v|, |u|) = (|u'| + |v'|, |v'|, |u'|)$ and $x^u y^v > x^{u'} y^{v'}$ reverse lexicographically induced by $y_1 > \dots > y_m > x_1 > \dots > x_n$ (see [8] for details on monomial orders). For a bigraded ideal J we denote by $\text{in}(J)$ the monomial ideal generated by $\text{in}(f)$ for $f \in J$.

In [2] the bigeneric initial ideal $\text{bigin}(J)$ was constructed in the following way: Let $G = \text{GL}(n, K) \times \text{GL}(m, K)$ and $g = (d_{ij}, e_{kl}) \in G$. Then g defines an S automorphism by extending $g(x_j) = \sum_i d_{ij} x_i$ and $g(y_l) = \sum_k e_{kl} y_k$. There exists a non empty Zariski open set $U \subset G$ such that for all $g \in U$ we have $\text{bigin}(J) = \text{in}(gJ)$. We call these $g \in U$ *generic* (for J).

If $\text{char}(K) = 0$, then $\text{bigin}(J)$ is strongly bistable for every bigraded ideal J . See for example [3] for similar results in the graded case.

Proposition 4.2. *Let $J \subset S$ be a bigraded ideal. If $\text{char}(K) = 0$, then*

$$\text{reg}_x(S/J) = \text{reg}_x(S/\text{bigin}(J)).$$

Proof. Set $\mathbf{x} = x_n, \dots, x_1$, choose $g \in G$ generic for J and let $\tilde{\mathbf{x}} = \tilde{x}_n, \dots, \tilde{x}_1$ with $x_i = g(\tilde{x}_i)$. We may assume that the sequence $\tilde{\mathbf{x}}$ is almost regular for S/J with respect to the x -degree. Furthermore \mathbf{x} is almost regular for $S/\text{bigin}(J)$ with respect to the x -degree by 4.1. We have

$$(0 :_{S/((\tilde{x}_n, \dots, \tilde{x}_{i+1})+J)} \tilde{x}_i) \cong (0 :_{S/((x_n, \dots, x_{i+1})+g(J))} x_i).$$

It follows from [8, 15.12] that

$$(0 :_{S/((x_n, \dots, x_{i+1})+g(J))} x_i) \cong (0 :_{S/((x_n, \dots, x_{i+1})+\text{bigin}(J))} x_i).$$

By 2.2 we get the desired result. \square

Remark 4.3. (i) In general it is not true that

$$\text{reg}_y(S/J) = \text{reg}_y(S/\text{bigin}(J)).$$

For example let $S = K[x_1, \dots, x_3, y_1, \dots, y_3]$ and $J = (y_2 x_2 - y_1 x_3, y_3 x_1 - y_1 x_3)$. Then the minimal bigraded free resolution of S/J is given by

$$0 \rightarrow S(-2, -2) \rightarrow S(-1, -1) \oplus S(-1, -1) \rightarrow S \rightarrow 0.$$

Therefore

$$\text{reg}_x(S/J) = 0 \text{ and } \text{reg}_y(S/J) = 0.$$

On the other hand $\text{bigin}(J) = (y_2 x_1, y_1 x_1, y_1^2 x_2)$ with the minimal bigraded free resolution of $S/\text{bigin}(J)$

$$\begin{aligned} 0 &\rightarrow S(-2, -2) \oplus S(-1, -2) \\ &\rightarrow S(-1, -1) \oplus S(-1, -1) \oplus S(-1, -2) \rightarrow S \rightarrow 0. \end{aligned}$$

Hence

$$\text{reg}_x(S/\text{bigin}(J)) = 0 \text{ and } \text{reg}_y(S/\text{bigin}(J)) = 1.$$

(ii) It is easy to calculate the x - and the y -regularity of bistable ideals. In fact, in [2] it was shown that for a bistable ideal $J \subset S$ we have

$$\text{reg}_x(J) = m_x(J) \text{ and } \text{reg}_y(J) = m_y(J).$$

5. REGULARITY OF POWERS AND SYMBOLIC POWERS OF IDEALS

Consider a bigraded algebra $R = S/J$, where J is a bistable ideal. Note that by 4.1 the sequence x_n, \dots, x_1 is almost regular for R with respect to the x -degree. For $i \in [n]$ and $j \geq 0$ we define

$$m_j^i = \max\{a : (0 :_{R/(x_n, \dots, x_{i+1})R} x_i)_{(a,j)} \neq 0\}.$$

Furthermore for a bistable ideal J and $v \in \mathbb{N}^n$ we set $J_{(*,v)} = I_v y^v$, where $I_v \subset S_x$ is again a monomial ideal, which is stable in the usual sense, that is if $x^u \in I_v$, then $x_i x^u / x_{m(u)} \in I_v$ for $i \leq m(u)$.

Proposition 5.1. *Let $J \subseteq S$ be a bistable ideal and $R = S/J$. Then*

- (i) *For every $i \in [n]$ and for $j \geq 0$ we have $m_j^i \leq m_x(J) - 1$.*
- (ii) *For every $i \in [n]$ and for $j \geq m_y(J)$ we have $m_j^i = m_{m_y(J)}^i$.*

Proof. If $G(J) = \{x^{u^k} y^{v^k} : k = 1, \dots, r\}$, then $I_v = (x_{u^k} : v^k \preceq v)$. This means that for all $x^u \in G(I_v)$ one has $|u| \leq m_x(J)$. For fixed v with $|v| = j$ we have

$$(0 :_{R/(x_n, \dots, x_{i+1})R} x_i)_{(*,v)} = \frac{((x_n, \dots, x_{i+1}) + I_v :_{S_x} x_i)}{(x_n, \dots, x_{i+1}) + I_v} y^v$$

and as a K -vector space

$$\frac{((x_n, \dots, x_{i+1}) + I_v :_{S_x} x_i)}{(x_n, \dots, x_{i+1}) + I_v} y^v = \bigoplus_{x^u \in G(I_v), m(u)=i} K((x^u / x_{m(u)}) y^v),$$

because I_v is stable. It follows that

$$m_j^i \leq m_x(J) - 1,$$

which is (i).

To prove (ii) we replace J by $J_{(*, \geq m_y(J))}$ and hence may assume that J is generated in y -degree $t = m_y(J)$. Then $G(J) = \{x^{u^k} y^{v^k} : k = 1, \dots, r\}$ with $|v^k| = t$. Let $|u^k|$ be maximal with $m(u^k) = i$ and define $c^i = |u^k| - 1$. We show that $m_j^i = c^i$ for $j \geq t$ and this will prove (ii).

First we claim that for $s \geq 0$

$$0 \neq [(x^{u^k} / x_i) y^{v^k} y_n^s] \in (0 :_{R/(x_n, \dots, x_{i+1})R} x_i)_{(*, s+t)}.$$

Assume this is not the case, then either

$$(x^{u^k} / x_i) y^{v^k} y_n^s = x_l x^{u'} y^{v'}$$

for some u', v' and $l \geq i + 1$ which contradicts to $m(u^k) = i$. Or

$$(x^{u^k} / x_i) y^{v^k} y_n^s = x^{u^{k'}} y^{v^{k'}} x^{u'} y^{v'}$$

for $x^{u^{k'}} y^{v^{k'}} \in G(J)$. It follows $|v'| = s$. Let k_1 be the largest integer l with $y_n^l | y^{v^{k'}}$, then

$$(x^{u^k} / x_i) y^{v^k} = ((x^{u^{k'}} y^{v^{k'}} x^{u'}) / y_n^{k_1}) y^{v'} / y_n^{s-k_1} \in J,$$

because J is bistable, and this is again a contradiction. Therefore the claim is true and we get $m_{s+t}^i \geq c^i$ for $s \geq 0$. By an analogue argument to (i) we have $m_{s+t}^i \leq c^i$, and this concludes the proof. \square

Remark 5.2. This proposition could also be formulated by changing the roles of \mathbf{x} and \mathbf{y} .

Let A be a standard graded K -algebra. For a finitely generated graded A -module M the usual Castelnuovo-Mumford regularity is defined to be

$$\text{reg}^A(M) = \sup\{r : \beta_{i,i+r}^A(M) \neq 0 \text{ for some } i\}.$$

In [7] and [12] it was shown that for a graded ideal $I \subset S_x$ the function $\text{reg}^{S_x}(I^j)$ is a linear function $pj + c$ for $j \gg 0$. In the case that I is generated in one degree we give an upper bound for c and find an integer j_0 for which $\text{reg}^{S_x}(I^j)$ is a linear function for all $j \geq j_0$.

Theorem 5.3. *Let $I = (f_1, \dots, f_m) \subset S_x$ be a graded ideal generated in degree d . Let $R(I) = S/J$ for a bigraded ideal J . Then*

- (i) $\text{reg}^{S_x}(I^j) \leq jd + \text{reg}_x^S(R(I))$.
- (ii) $\text{reg}^{S_x}(I^j) = jd + c$ for $j \geq m_y(\text{bigin}(J))$ and some constant $0 \leq c \leq \text{reg}_x^S(R(I))$.

Proof. We choose an almost regular sequence $\tilde{\mathbf{x}} = \tilde{x}_n, \dots, \tilde{x}_1$ for $R(I)$ over S with respect to the x -degree. Thus we have that for all j the sequence $\tilde{\mathbf{x}}$ is almost regular for I^j over S_x in the sense of [3], because $R(I)_{(*,j)}(-dj) \cong I^j$ and

$$(0 :_{R(I)/(\tilde{x}_n, \dots, \tilde{x}_{i+1})R(I)} \tilde{x}_i)_{(*,j)}(-dj) = (0 :_{I^j/(\tilde{x}_n, \dots, \tilde{x}_{i+1})I^j} \tilde{x}_i).$$

Define m_j^i for $\text{bigin}(J)$ as in 5.1. Since

$$(0 :_{R(I)/(\tilde{x}_n, \dots, \tilde{x}_{i+1})R(I)} \tilde{x}_i) \cong (0 :_{S/((x_n, \dots, x_{i+1}) + \text{bigin}(J))} x_i),$$

it follows that

$$jd + m_j^i = r_j^i = \max\{l : (0 :_{I^j/(\tilde{x}_n, \dots, \tilde{x}_{i+1})I^j} \tilde{x}_i)_l \neq 0\}.$$

By a characterization of the regularity in [3] we have

$$\text{reg}^{S_x}(I^j) = \max\{jd, r_j^1, \dots, r_j^n\}.$$

Hence the assertion follows from 4.2, 4.3(ii) and 5.1. \square

Similarly as in 5.3 one has:

Theorem 5.4. *Let $I = (f_1, \dots, f_m) \subset S_x$ be a graded ideal generated in degree d . Let $S(I) = S/J$ for a bigraded ideal J . Then*

- (i) $\text{reg}^{S_x}(S^j(I)) \leq jd + \text{reg}_x^S(S(I))$.
- (ii) $\text{reg}^{S_x}(S^j(I)) = jd + c$ for $j \geq m_y(\text{bigin}(J))$ and some constant $0 \leq c \leq \text{reg}_x^S(S(I))$.

Blum [4] proved the following with different methods.

Corollary 5.5. *Let $I = (f_1, \dots, f_m) \subset S_x$ be a graded ideal generated in degree d .*

- (i) *If $\text{reg}_x(R(I)) = 0$, then $\text{reg}^{S_x}(I^j) = jd$ for $j \geq 1$.*

(ii) If $\text{reg}_x(S(I)) = 0$, then $\text{reg}^{S_x}(S^j(I)) = jd$ for $j \geq 1$.

Proof. This follows from 5.3 and 5.4. \square

Next we give a more sophisticated bound for the regularity function becoming linear. Consider a bigraded algebra R . Let y be almost regular for all $\text{Tor}_i^S(S/\mathfrak{m}_x, R)$ with respect to the y -degree. Define

$$w(R) = \max\{b : (0 :_{\text{Tor}_i^S(S/\mathfrak{m}_x, R)} y)_{(*,b) \neq 0} \text{ for an } i \in [n]\}.$$

Lemma 5.6. *Let $I = (f_1, \dots, f_m) \subset S_x$ be a graded ideal generated in degree d .*

- (i) *For $j > w(R(I))$ we have $\text{reg}^{S_x}(I^{j+1}) \geq \text{reg}^{S_x}(I^j) + d$.*
- (ii) *For $j > w(S(I))$ we have $\text{reg}^{S_x}(S^{j+1}(I)) \geq \text{reg}^{S_x}(S^j(I)) + d$.*

Proof. We prove the case $R = R(I)$. For $j > w(R)$ one has the exact sequence

$$0 \rightarrow \text{Tor}_i^S(S/\mathfrak{m}_x, R)_{(*,j)} \xrightarrow{y} \text{Tor}_i^S(S/\mathfrak{m}_x, R)_{(*,j+1)}.$$

In [7, 3.3] it was shown that

$$\text{Tor}_i^S(S/\mathfrak{m}_x, R)_{(a,j)} \cong \text{Tor}_i^{S_x}(K, I^j)_{a+jd}$$

and this concludes the proof. \square

Lemma 5.7. *Let R be a bigraded algebra. Then*

$$H_*(0, m)_{(*,j)} = 0 \text{ for } j > \text{reg}_y(R) + m.$$

Proof. We know that

$$H_*(0, m) \cong \text{Tor}_*(S/\mathfrak{m}_y, R) \cong H_*(S/\mathfrak{m}_y \otimes_S F_*),$$

where F_* is the minimal bigraded free resolution of R over S . The assertion follows. \square

Thus we get the following exact sequences.

Corollary 5.8. *Let $I = (f_1, \dots, f_m) \subset S_x$ be a graded ideal generated in degree d .*

- (i) *For $j > \text{reg}_y(R(I)) + m$ we have the exact sequence*

$$0 \rightarrow I^{j-m}(-md) \rightarrow \bigoplus_m I^{j-m+1}(-(m-1)d) \rightarrow \dots \rightarrow \bigoplus_m I^{j-1}(-d) \rightarrow I^j \rightarrow 0.$$

- (ii) *For $j > \text{reg}_y(S(I)) + m$ we have the exact sequence*

$$\begin{aligned} 0 \rightarrow S^{j-m}(I)(-md) &\rightarrow \bigoplus_m S^{j-m+1}(I)(-(m-1)d) \rightarrow \\ &\dots \rightarrow \bigoplus_m S^{j-1}(I)(-d) \rightarrow S^j(I) \rightarrow 0. \end{aligned}$$

Proof. This statement follows from 5.7 and the fact that $R(I)_{(*,j)}(-jd) \cong I^j$ and $S(I)_{(*,j)}(-jd) \cong S^j(I)$, respectively. \square

Corollary 5.9. *Let $I = (f_1, \dots, f_m) \subset S_x$ be a graded ideal generated in degree d . Then*

(i) For $j \geq \max\{\operatorname{reg}_y(R(I)) + m, w(R(I)) + m\}$ we have

$$\operatorname{reg}^{S_x}(I^{j+1}) = d + \operatorname{reg}^{S_x}(I^j).$$

(ii) For $j \geq \max\{\operatorname{reg}_y(S(I)) + m, w(S(I)) + m\}$ we have

$$\operatorname{reg}^{S_x}(S^{j+1}(I)) = d + \operatorname{reg}^{S_x}(S^j(I)).$$

Proof. We prove the corollary for $R(I)$. By 5.8 we get by standard arguments (see 6.1 for the bigraded case) that for $j \geq \operatorname{reg}_y(R) + m$

$$\operatorname{reg}^{S_x}(I^{j+1}) \leq \max_{i \in [m]} \{\operatorname{reg}^{S_x}(I^{j+1-i}) + id - i\}.$$

This together with 5.6 proves the claim. \square

We now consider a special case, where $\operatorname{reg}^{S_x}(I^j)$ can be computed precisely.

Proposition 5.10. *Let $R = S/J$ be a bigraded algebra, which is a complete intersection. Let $\{z_1, \dots, z_t\}$ be a homogeneous minimal system of generators of J which is a regular sequence. Assume that $\deg_x(z_t) \geq \dots \geq \deg_x(z_1) > 0$. Then for all $j \geq t$*

$$\operatorname{reg}^{S_x}(R_{(*,j+1)}) = \operatorname{reg}^{S_x}(R_{(*,j)}).$$

If in addition $\deg_x(z_k) = 1$ for all k , then for $j \geq 1$

$$\operatorname{reg}^{S_x}(R_{(*,j)}) = 0.$$

Proof. The Koszul $K_\bullet(\mathbf{z})$ complex in $\{z_1, \dots, z_t\}$ provides a minimal bigraded free resolution of R , because these elements form a regular sequence. $(*, j)$ is an exact functor on complexes of bigraded modules. Note that $K_\bullet(\mathbf{z})_{(*,j)}$ is an exact complex of free S_x -modules, because

$$K_i(\mathbf{z}) \cong \bigoplus_{\{j_1, \dots, j_i\} \subset [t]} S(-\deg(z_{j_1}) - \dots - \deg(z_{j_i})),$$

and

$$S(-a, -b)_{(*,j)} \cong \bigoplus_{|v|=j-b} S_x(-a)y^v.$$

Furthermore $K_\bullet(\mathbf{z})_{(*,j)}$ is minimal by the additional assumption $\deg_x(z_k) > 0$. For $j \geq t$ we have

$$\operatorname{reg}^{S_x}(R_{(*,j)}) = \max_{i \in [t]} \{\deg_x(z_t) + \dots + \deg_x(z_{t-i+1}) - i\}$$

and this is independent of j . If in addition $\deg_x(z_k) = 1$ for all k , then for $j \geq 1$

$$\operatorname{reg}^{S_x}(R_{(*,j)}) = 0.$$

\square

Recall that a graded ideal I is said to be of linear type, if $R(I) = S(I)$. For example ideals generated by d -sequences are of linear type. Let $I = (f_1, \dots, f_m) \subset$

S_x be a graded ideal, which is Cohen-Macaulay of codim 2. By the Hilbert-Burch theorem S_x/I has a minimal graded free resolution

$$0 \rightarrow \bigoplus_{i=1}^{m-1} S_x(-b_i) \xrightarrow{B} \bigoplus_{i=1}^m S_x(-a_i) \rightarrow S_x \rightarrow S_x/I \rightarrow 0.$$

where $B = (b_{i,j})$ is a $m \times m - 1$ -matrix with $b_{i,j} \in \mathfrak{m}$ and we may assume that the ideal I is generated by the maximal minors of B . The matrix B is said to be the Hilbert-Burch matrix of I . If I is generated in degree d , it follows that $S(I) = S/J$, where J is the bigraded ideal $(\sum_{i=1}^m b_{i,j}y_i : j = 1, \dots, m-1)$.

Corollary 5.11. *Let $I = (f_1, \dots, f_m) \subset S_x$ be a graded ideal generated in degree d , which is Cohen-Macaulay of codim 2 and of linear type. Then for $j \geq m-1$*

$$\operatorname{reg}^{S_x}(I^{j+1}) = \operatorname{reg}^{S_x}(I^j) + d.$$

If additionally $\deg_x(b_{i,j}) = 1$ for $b_{i,j} \neq 0$, then the equality holds for $j \geq 1$.

Proof. Let $B = (b_{i,j})$ be the $m \times m - 1$ Hilbert-Burch matrix of I . Because I is of linear type, we have $R(I) = S/J$ with $J = (\sum_{i=1}^m b_{i,j}y_i : j = 1, \dots, m-1)$. One knows that $(\operatorname{Krull-})\dim(R(I)) = n+1$. Since J is defined by $m-1$ equations, we conclude that $R(I)$ is a complete intersection. Now apply 5.10. \square

6. BIGRADED VERONESE ALGEBRAS

Let R be a bigraded algebra and fix $\tilde{\Delta} = (s, t)$. We call

$$R_{\tilde{\Delta}} = \bigoplus_{(a,b) \in \mathbb{N}^2} R_{(as, bt)}$$

the *bigraded Veronese algebra* of R with respect to $\tilde{\Delta}$ (see for example [9] for the graded case and [6] for similar constructions in the bigraded case). Note that this is again a bigraded algebra.

We want to relate $\operatorname{reg}_x^{S_{\tilde{\Delta}}}(R_{\tilde{\Delta}})$ and $\operatorname{reg}_y^{S_{\tilde{\Delta}}}(R_{\tilde{\Delta}})$ to $\operatorname{reg}_x^S(R)$ and $\operatorname{reg}_y^S(R)$. We follow the way presented in [6] for the case of diagonals.

Lemma 6.1. *Let R be a bigraded algebra and*

$$0 \rightarrow M_r \rightarrow \dots \rightarrow M_0 \rightarrow N \rightarrow 0$$

be an exact complex of finitely generated bigraded R -modules. Then

$$\operatorname{reg}_x^R(N) \leq \sup_{0 \leq k \leq r} \{\operatorname{reg}_x^R(M_k) - k\}$$

and

$$\operatorname{reg}_y^R(N) \leq \sup_{0 \leq k \leq r} \{\operatorname{reg}_y^R(M_k) - k\}.$$

Proof. We prove by induction on r the inequality for $\operatorname{reg}_x^R(N)$. The case $r = 0$ is trivial. Now let $r > 0$, and consider

$$0 \rightarrow N' \rightarrow M_0 \rightarrow N \rightarrow 0,$$

where N' is the kernel of $M_0 \rightarrow N$. Then for every integer a we have the exact sequence

$$\dots \rightarrow \operatorname{Tor}_i^R(M_0, K)_{(a+i,*)} \rightarrow \operatorname{Tor}_i^R(N, K)_{(a+i,*)} \rightarrow \operatorname{Tor}_{i-1}^R(N', K)_{(a+1+i-1,*)} \rightarrow \dots$$

and get

$$\operatorname{reg}_x^R(N) \leq \sup\{\operatorname{reg}_x^R(M_0), \operatorname{reg}_x^R(N') - 1\} \leq \sup_{0 \leq k \leq r} \{\operatorname{reg}_x^R(M_k) - k\},$$

where the last inequality follows from the induction hypothesis. Analogously we get the inequality for $\operatorname{reg}_y^R(N)$. \square

Lemma 6.2. *Let A and B be graded K -algebras, let M be a finitely generated A -module and let N be a finitely generated B -module. Then $M \otimes_K N$ is a finitely generated $A \otimes_K B$ -module with*

$$\operatorname{reg}_x^{A \otimes_K B}(M \otimes_K N) = \operatorname{reg}_x^A(M) \text{ and } \operatorname{reg}_y^{A \otimes_K B}(M \otimes_K N) = \operatorname{reg}_y^B(N).$$

Proof. Let F_\bullet be a minimal graded free resolution of M over A and G_\bullet be a minimal graded free resolution of N over B . Then $H_\bullet = F_\bullet \otimes_K G_\bullet$ is a minimal bigraded free resolution of $M \otimes_K N$ over $A \otimes_K B$ with $H_i = \bigoplus_{k+l=i} F_k \otimes G_l$. Since $A(-a) \otimes_K B(-b) = (A \otimes_K B)(-a, -b)$, the assertion follows. \square

Theorem 6.3. *Let R be a bigraded algebra, $\tilde{\Delta} = (s, t)$. Then*

$$\operatorname{reg}_x^{S_{\tilde{\Delta}}}(R_{\tilde{\Delta}}) \leq \max\{c: c = \lceil a/s \rceil - i, \beta_{i,(a,b)}^S(R) \neq 0 \text{ for some } i, b\},$$

and

$$\operatorname{reg}_y^{S_{\tilde{\Delta}}}(R_{\tilde{\Delta}}) \leq \max\{c: c = \lceil b/t \rceil - i, \beta_{i,(a,b)}^S(R) \neq 0 \text{ for some } i, a\}.$$

Proof. By symmetry it suffices to show the inequality for $\operatorname{reg}_x^{S_{\tilde{\Delta}}}(R_{\tilde{\Delta}})$. Let

$$0 \rightarrow F_r \rightarrow \dots \rightarrow F_0 \rightarrow R \rightarrow 0$$

be a minimal bigraded free resolution of R over S . We obtain the exact complex of finitely generated $S_{\tilde{\Delta}}$ -modules

$$0 \rightarrow (F_r)_{\tilde{\Delta}} \rightarrow \dots \rightarrow (F_0)_{\tilde{\Delta}} \rightarrow R_{\tilde{\Delta}} \rightarrow 0.$$

By 6.1 we have

$$\operatorname{reg}_x^{S_{\tilde{\Delta}}}(R_{\tilde{\Delta}}) \leq \max\{\operatorname{reg}_x^{S_{\tilde{\Delta}}}((F_i)_{\tilde{\Delta}}) - i\}.$$

Since

$$F_i = \bigoplus_{(a,b) \in \mathbb{N}^2} S(-a, -b)^{\beta_{i,(a,b)}^S(R)},$$

one has

$$\operatorname{reg}_x^{S_{\tilde{\Delta}}}((F_i)_{\tilde{\Delta}}) = \max\{\operatorname{reg}_x^{S_{\tilde{\Delta}}} S(-a, -b)_{\tilde{\Delta}}: \beta_{i,(a,b)}^S(R) \neq 0\}.$$

We have to compute $\operatorname{reg}_x^{S_{\tilde{\Delta}}} S(-a, -b)_{\tilde{\Delta}}$. Let M_0, \dots, M_{s-1} be the relative Veronese modules of S_x and N_0, \dots, N_{t-1} be the relative Veronese modules of S_y . That is

$M_j = \bigoplus_{k \in \mathbb{N}} (S_x)_{ks+j}$ for $j = 0, \dots, s-1$ and $N_j = \bigoplus_{k \in \mathbb{N}} (S_y)_{kt+j}$ for $j = 0, \dots, t-1$. Then

$$S(-a, -b)_{\tilde{\Delta}} = \bigoplus_{(k,l) \in \mathbb{N}^2} (S_x)_{ks-a} \otimes_K (S_y)_{lt-b} = M_i(-\lceil a/s \rceil) \otimes_K N_j(-\lceil b/t \rceil),$$

where $i \equiv -a \pmod s$ for $0 \leq i \leq s-1$ and $j \equiv -b \pmod t$ for $0 \leq j \leq t-1$.

The relative Veronese modules over a polynomial ring have a linear resolution over the Veronese algebra by [1]. Hence by 6.2

$$\operatorname{reg}_x^{S_{\tilde{\Delta}}} S(-a, -b)_{\tilde{\Delta}} = \lceil a/s \rceil.$$

This concludes the proof. \square

Corollary 6.4. *Let R be a bigraded algebra.*

- (i) *For $s \gg 0$ and $\tilde{\Delta} = (s, t)$ one has $\operatorname{reg}_x^{S_{\tilde{\Delta}}}(R_{\tilde{\Delta}}) = 0$.*
- (ii) *For $t \gg 0$ and $\tilde{\Delta} = (s, t)$ one has $\operatorname{reg}_y^{S_{\tilde{\Delta}}}(R_{\tilde{\Delta}}) = 0$.*
