Non-recursive expressions for even-index Bernoulli numbers: A remarkable sequence of determinants.

Renaat Van Malderen

November 11, 2018

Abstract

Bernoulli numbers are usually expressed in terms of their lower index numbers (recursive). This paper gives explicit formulas for Bernoulli numbers of even index. The formulas contain a remarkable sequence of determinants. The value of these determinants for variable dimension is investigated.

Keywords: Number theory, Bernoulli numbers, non-recursive expressions, evaluation of determinants.

1 Introduction.

In a previous short paper (ref. arXiv: math.NT/0503160 v1 8 Mar 2005) the author presented an explicit formula for Bernoulli numbers of even index based on a sequence of determinants. This particular formula was an accidental byproduct of a different mathematical investigation. The proof via this route was fairly tedious and it was decided to just publish the formula and see wether there was any interest in it at all.

Mr Robin Chapman at the University of Exeter in the UK promptly responded and provided a short and elegant proof using geometrical transform techniques (generating functions). Also a request was received from the Mathematical Society in Korea for providing a proof for their Newsletter of JMS. Further requests were received from China.

As a result this new version of the earlier short paper provides three similar explicit expressions for Bernoulli numbers. A first one is derived based on the sequence of determinants mentioned earlier. The proof of the second and third one starts from the first one and uses transform techniques similar to Mr. R.Chapman's. Finally the value of the sequence of determinants is investigated.

2 Non-recursive expression for even-index Bernoulli numbers.

First a sequence of determinants D_k (with k= 1, 2, 3, ...) is defined as follows:

$$D_{1} = \frac{1}{3!}$$

$$D_{2} = \begin{vmatrix} \frac{1}{3!} & \frac{1}{5!} \\ 1 & \frac{1}{3!} \end{vmatrix}$$

$$D_{3} = \begin{vmatrix} \frac{1}{3!} & \frac{1}{5!} & \frac{1}{7!} \\ 1 & \frac{1}{3!} & \frac{1}{5!} \\ 0 & 1 & \frac{1}{3!} \end{vmatrix}$$

$$D_{4} = \begin{vmatrix} \frac{1}{3!} & \frac{1}{5!} & \frac{1}{7!} & \frac{1}{9!} \\ 1 & \frac{1}{3!} & \frac{1}{5!} & \frac{1}{7!} \\ 0 & 1 & \frac{1}{3!} & \frac{1}{5!} \\ 0 & 1 & \frac{1}{3!} & \frac{1}{5!} \end{vmatrix}$$
 etc.....

For convenience we also define

$$D_0 = 1 \tag{2.1}$$

Let B_{2p} (with p= 1, 2, 3, ...) be the even Bernoulli number of index 2p. B_{2p} is then given by either of the following formulas:

$$B_{2p} = \frac{(-1)^p (2p)!}{2} \left\{ \sum_{l=0}^p \frac{(-1)^l D_{p-l}}{(2l)!} + D_p \right\}$$
(2.2)

$$B_{2p} = -2p + \frac{(-1)^p (2p)!}{2^{2p}} \left\{ \sum_{l=0}^p \frac{(-1)^l 3^{2l} D_{p-l}}{(2l)!} \right\}$$
(2.3)

$$B_{2p} = \frac{(-1)^{p+1}(2p)!D_p}{2(2^{2p-1}-1)}$$
(2.4)

3 Relation between the determinants D_k .

The determinants D_k in (2.1) are in explicit form. Nevertheless a recursive relation among the D_k 's may be given as is obvious from their definition. This relation may be written successively as:

$$D_1 = \frac{1}{3!} D_0$$

$$D_2 = \frac{1}{3!} D_1 - \frac{1}{5!} D_0$$

$$D_3 = \frac{1}{3!} D_2 - \frac{1}{5!} D_1 + \frac{1}{7!} D_0$$

$$D_4 = \frac{1}{3!} D_3 - \frac{1}{5!} D_2 + \frac{1}{7!} D_1 - \frac{1}{9!} D_0$$

or in general:

$$D_k = \sum_{l=1}^k \frac{(-1)^{l-1} D_{k-l}}{(2l+1)!}$$
(3.1)

Equivalently:

$$\sum_{l=0}^{k} \frac{(-1)^{l} D_{k-l}}{(2l+1)!} = 0 \tag{3.2}$$

We start from the well-known recursive relation among even-index Bernoulli numbers:

$$\sum_{k=1}^{p} \begin{pmatrix} 2p\\ 2k-1 \end{pmatrix} \frac{B_{2k}}{2k} = \frac{1}{2} - \frac{1}{2p+1}$$
(4.1)

The easiest way to proceed is to take a specific case, e.g. start with p=1, 2, 3:

$$\begin{pmatrix} 2\\1 \end{pmatrix} \frac{B_2}{2} = \frac{1}{2} - \frac{1}{3}$$
$$\begin{pmatrix} 4\\1 \end{pmatrix} \frac{B_2}{2} + \begin{pmatrix} 4\\3 \end{pmatrix} \frac{B_4}{4} = \frac{1}{2} - \frac{1}{5}$$
$$\begin{pmatrix} 6\\1 \end{pmatrix} \frac{B_2}{2} + \begin{pmatrix} 6\\3 \end{pmatrix} \frac{B_4}{4} + \begin{pmatrix} 6\\5 \end{pmatrix} \frac{B_6}{6} = \frac{1}{2} - \frac{1}{7}$$

After some manipulation and in matrix form:

$$\begin{bmatrix} \frac{1}{1!} & 0 & 0\\ \frac{1}{3!} & \frac{1}{1!} & 0\\ \frac{1}{5!} & \frac{1}{3!} & \frac{1}{1!} \end{bmatrix} \begin{bmatrix} \frac{B_2}{2!}\\ \frac{B_4}{4!}\\ \frac{B_6}{6!} \end{bmatrix} = \frac{1}{2} \begin{bmatrix} \frac{1}{2!}\\ \frac{1}{4!}\\ \frac{1}{6!} \end{bmatrix} - \begin{bmatrix} \frac{1}{3!}\\ \frac{1}{5!}\\ \frac{1}{7!} \end{bmatrix}$$

The determinant of this system equals 1.

Solving for $\frac{B_6}{6!}$ and keeping in mind the definition of the determinants D_k :

$$\begin{aligned} \frac{B_6}{6!} &= (-1)^2 \left[\frac{1}{2} \left(\frac{D_2}{2!} - \frac{D_1}{4!} + \frac{D_0}{6!} \right) - \left(\frac{D_2}{3!} - \frac{D_1}{5!} + \frac{D_0}{7!} \right) \right] \\ &= (-1)^3 \frac{1}{2} \left[\left(D_3 - \frac{D_2}{2!} + \frac{D_1}{4!} - \frac{D_0}{6!} \right) + D_3 \right] \end{aligned}$$

or:

$$B_6 = (-1)^3 \frac{6!}{2} \left[\sum_{l=0}^3 \frac{(-1)^l D_{3-l}}{(2l)!} + D_3 \right]$$

It is obvious that this procedure may be continued for ever increasing values of p. This proves (2.2).

5 Proof of formulas (2.3) **and** (2.4)**.**

Notice that formulas (2.2), (2.3) and (2.4) also apply to the case p=0, i.e. $B_0=1$. In terms of geometric transforms, parts of formulas (2.2) and (2.3) come close to a convolution.

By expressing the transforms of both $\frac{(-1)^l}{(2l)!}$ and D_p as series in even powers of the complex variable z we achieve convolutions.

Let:

$$D(z) = \sum_{k=0}^{\infty} D_k z^{2k}$$
$$F(z) = \sum_{l=0}^{\infty} \frac{(-1)^l z^{2l}}{(2l+1)!} = \frac{\sin z}{z}$$
(5.1)

Convolving D(z) with F(z):

$$G(z) = D(z)F(z) = \sum_{k=0}^{\infty} \sum_{l=0}^{k} \frac{(-1)^{l} D_{k-l} z^{2k}}{(2l+1)!}$$

Since (see (3.2)):

 $\sum_{l=0}^k \frac{(-1)^l D_{k-l}}{(2l+1)!} = 0$ for k=1,2... and 1 for k=0, the result is the unit impulse i.e. G(z)=1.

Therefore:

$$D(z) = \frac{z}{\sin z} \tag{5.2}$$

Looking now at formula (2.2), the geometric transform of

$$\frac{(-1)^p B_{2p}}{(2p)!} = \frac{1}{2} \left(\sum_{l=0}^p \frac{(-1)^l D_{p-l}}{(2l)!} + D_p \right) \text{ equals :}$$
$$\frac{D(z) \cos z + D(z)}{2} = D(z) \cos^2 \left(\frac{z}{2}\right) = \frac{z \cos\left(\frac{z}{2}\right)}{2 \sin\left(\frac{z}{2}\right)} \tag{5.3}$$

By (2.3) the transform of the same expression

$$\frac{(-1)^{p}B_{2p}}{(2p)!} = \frac{2p(-1)^{p+1}}{(2p)!} + \frac{1}{2^{2p}} \sum_{l=0}^{p} \frac{(-1)^{l} 3^{2l} D_{p-l}}{(2l)!} \text{ equals:}$$

$$z \sin z + \cos\left(\frac{3z}{2}\right) D(\frac{z}{2}) = z \left(\sin z + \frac{\cos\left(\frac{3z}{2}\right)}{2\sin\left(\frac{z}{2}\right)}\right)$$

$$= \frac{z \left(4\sin^{2}\left(\frac{z}{2}\right)\cos\left(\frac{z}{2}\right) + 4\cos^{3}\left(\frac{z}{2}\right) - 3\cos\left(\frac{z}{2}\right)\right)}{2\sin\left(\frac{z}{2}\right)} = \frac{z\cos\left(\frac{z}{2}\right)}{2\sin\left(\frac{z}{2}\right)} \tag{5.4}$$

i.e. (5.3) and (5.4) are identical. This proves formula (2.3).

We proceed in a similar way for formula (2.4):

Let: $W(p) = \frac{(-1)^p B_{2p}}{(2p)!}$ and: $W(z) = \sum_{p=0}^{\infty} W_p z^{2p}$

We already know:

$$W(z) = \frac{z\cos\left(\frac{z}{2}\right)}{2\sin\left(\frac{z}{2}\right)} \tag{5.5}$$

Formula (2.4) claims: $D_p = -(2^{2p}-2)W_p$

The geometric transform of (5.5) equals:

$$\frac{1}{2}\left(\frac{-2z\cos z}{\sin z} + \frac{2z\cos\left(\frac{z}{2}\right)}{\sin\left(\frac{z}{2}\right)}\right) = \frac{z}{\sin z} = D(z)$$

This proves (2.4).

6 Value of the determinants D_k .

From (5.2):

$$D(z) = \frac{z}{\sin z} = \sum_{p=0}^{\infty} D_p z^{2p}$$
(6.1)

$$D_p = \frac{1}{2\pi i} \oint \frac{D(z)dz}{z^{2p+1}} = \frac{1}{2\pi i} \oint \frac{dz}{z^{2p} \sin z}$$
(6.2)

where the integral is taken along a sufficiently small circle around the origin z=0.

We now use a well-known result:

$$\frac{1}{\sin z} = \frac{1}{z} + 2z \sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{\pi^2 k^2} \cdot \frac{1}{\left(1 - \frac{z^2}{\pi^2 k^2}\right)}$$

For $|z| \langle \pi \text{ and } k=1,2,...$, we are allowed to expand the last term in a power series. By dividing further by z^{2p} we obtain:

$$\frac{1}{z^{2p}\sin z} = \frac{1}{z^{2p+1}} + 2z \sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{\pi^2 k^2} \cdot \sum_{l=0}^{\infty} \frac{1}{\pi^{2l} k^{2l} z^{2(p-l)-1}}$$
(6.3)

The value of (6.2) equals the residue of (6.3).

For p=0 the residue equals 1, i.e. $D_0 = 1$ which is correct.

For $p \ge 1$ we look for terms where 2p-2l-1 = 1 or l=p-1, resulting in:

$$D_p = \frac{2}{\pi^{2p}} \sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k^{2p}} = \frac{2}{\pi^{2p}} \left(1 - \frac{1}{2^{2p-1}}\right) \zeta(2p) \tag{6.4}$$

or

$$\zeta(2p) = \frac{\pi^{2p} D_p}{2(1 - 2^{1 - 2p})} \tag{6.5}$$

in case one prefers to express it the other way around.

It is easily seen from (6.4) that for large p:

$$D_p \cong \frac{2}{\pi^{2p}} \tag{6.6}$$

or:

$$\lim_{p \to \infty} = \frac{\pi^{2p} D_p}{2} = 1$$
