## BEST CONSTANTS FOR UNCENTERED MAXIMAL FUNCTIONS

LOUKAS GRAFAKOS\* AND STEPHEN MONTGOMERY-SMITH\*

University of Missouri, Columbia

ABSTRACT. We precisely evaluate the operator norm of the uncentered Hardy-Littlewood maximal function on  $L^p(\mathbb{R}^1)$ . Consequently, we compute the operator norm of the "strong" maximal function on  $L^p(\mathbb{R}^n)$ , and we observe that the operator norm of the uncentered Hardy-Littlewood maximal function over balls on  $L^p(\mathbb{R}^n)$  grows exponentially as  $n \to \infty$ .

For a locally integrable function f on  $\mathbb{R}^n$ , let

$$(\mathcal{M}_n f)(x) = \sup_{B \ni x} \frac{1}{|B|} \int_B |f(y)| \, dy,$$

where the supremum is taken over all closed balls B that contain the point x.  $\mathcal{M}_n f$  is called the uncentered Hardy-Littlewood maximal function of f on  $\mathbb{R}^n$ . In this paper we find the precise value of the operator norm of  $\mathcal{M}_1$  on  $L^p(\mathbb{R}^1)$ . It turns out that this operator norm is the solution of an equation. Our main result is the following:

**Theorem.** For  $1 , the operator norm of <math>\mathcal{M}_1 : L^p(\mathbb{R}^1) \to L^p(\mathbb{R}^1)$  is the unique positive solution of the equation

(1) 
$$(p-1) x^p - p x^{p-1} - 1 = 0.$$

In order to prove our Theorem, we fix a nonnegative f and we introduce the left and right maximal functions:

$$(M_L f)(x) = \sup_{a < x} \frac{1}{x - a} \int_a^x f(t) dt$$
 and  $(M_R f)(x) = \sup_{b > x} \frac{1}{b - x} \int_x^b f(t) dt.$ 

For the proof of the next result, known popularly as the "sunrise lemma", we refer the reader to Lemma (21.75) (i), Ch VI in [HS].

**Lemma 1.** Let  $f \ge 0$  be in  $L^1(\mathbb{R}^1)$ . For each  $\lambda > 0$ , let  $C_{\lambda} = \{x : (M_L f)(x) > \lambda\}$  and  $D_{\lambda} = \{x : (M_R f)(x) > \lambda\}$ . Then

(2) 
$$\lambda |C_{\lambda}| = \int_{C_{\lambda}} f \, dt \quad and \quad \lambda |D_{\lambda}| = \int_{D_{\lambda}} f \, dt.$$

Now we are ready to prove the main lemma that leads to our Theorem. This next result may be viewed as the "correct" weak type estimate for the maximal function  $\mathcal{M}_1$ .

**Lemma 2.** Let  $f \ge 0$  be in  $L^1(\mathbb{R}^1)$ . For each  $\lambda > 0$ , let  $A_{\lambda} = \{x : (\mathcal{M}_1 f)(x) > \lambda\}$  and  $B_{\lambda} = \{x : f(x) > \lambda\}$ . Then

(3) 
$$\lambda(|A_{\lambda}| + |B_{\lambda}|) \le \int_{A_{\lambda}} f \, dt + \int_{B_{\lambda}} f \, dt$$

To prove (3), first note that

(4) 
$$\sup(M_L, M_R) = \mathcal{M}_1.$$

For, clearly  $\sup(M_L, M_R) \leq \mathcal{M}_1$ . On the other hand, it is easy to see that for each real number x,  $(\mathcal{M}_1 f)(x)$  is bounded by a convex combination of  $(M_L f)(x)$  and  $(M_R f)(x)$ .

Now we add the two equalities in (2). Then using the fact that  $A_{\lambda} = C_{\lambda} \cup D_{\lambda}$  which follows from (4), we obtain

(5) 
$$\lambda(|A_{\lambda}| + |C_{\lambda} \cap D_{\lambda}|) = \int_{A_{\lambda}} f \, dt + \int_{C_{\lambda} \cap D_{\lambda}} f \, dt.$$

Clearly  $B_{\lambda} - (C_{\lambda} \cap D_{\lambda})$  is a set of measure zero, and  $f \leq \lambda$  on  $(C_{\lambda} \cap D_{\lambda}) - B_{\lambda}$ . Therefore

(6) 
$$\int_{(C_{\lambda} \cap D_{\lambda}) - B_{\lambda}} f \, dt \leq \lambda |(C_{\lambda} \cap D_{\lambda}) - B_{\lambda}|.$$

Equations (5) and (6) now imply equation (3), as required.

To prove the inequality in our Theorem, we require the following fact.

**Lemma 3.** Let f and g be nonnegative functions on  $\mathbb{R}^1$ . Then if p > 1, we have

$$\int_0^\infty \lambda^{p-2} \int_{g(t)>\lambda} f(t) \, dt \, d\lambda = \frac{1}{p-1} \int_{\mathbb{R}^1} fg^{p-1} \, dt,$$

and if p > 0, we have

$$\int_0^\infty \lambda^{p-1} |\{g > \lambda\}| \, d\lambda = \frac{1}{p} \int_{\mathbb{R}^1} g^p \, dt.$$

The first equality is easily proved, since by Fubini's theorem, the left hand side is

$$\int_{-\infty}^{\infty} f(t) \int_{0}^{g(t)} \lambda^{p-2} \, d\lambda \, dt$$

which is readily seen to equal the right hand side. The second equality is the special case of the first when f = 1.

We now continue the proof of our Theorem. Multiplying (3) by  $\lambda^{(p-2)}$ , integrating  $\lambda$  from 0 to  $\infty$ , and applying Lemma 3, we obtain

$$\frac{1}{p} \|\mathcal{M}_1 f\|_p^p + \frac{1}{p} \|f\|_p^p \le \frac{1}{p-1} \|f\|_p^p + \frac{1}{p-1} \int_{\mathbb{R}^1} f(x) [(\mathcal{M}_1 f)(x)]^{p-1} \, dx,$$

that is,

$$(p-1)\|\mathcal{M}_1f\|_p^p - \int_{\mathbb{R}^1} f(x)[(\mathcal{M}_1f)(x)]^{p-1} \, dx - \|f\|_p^p \le 0.$$

Applying Hölder's inequality with exponents p and p/(p-1) to the second term, we obtain

(7) 
$$(p-1)\left(\frac{\|\mathcal{M}_1f\|_p}{\|f\|_p}\right)^p - p\left(\frac{\|\mathcal{M}_1f\|_p}{\|f\|_p}\right)^{p-1} - 1 \le 0,$$

from which we conclude that  $\frac{\|\mathcal{M}_1 f\|_p}{\|f\|_p} \leq c_p$ , where  $c_p$  is the unique positive solution of the (1).

To show that  $c_p$  is in fact the operator norm of  $\mathcal{M}_1$  on  $L^p(\mathbb{R}^1)$ , we construct an example. Note that equality in (3) is satisfied when f is even symmetrically decreasing and equality in (7) is satisfied when  $\mathcal{M}_1 f$  is a multiple of f. We are therefore led to the following example. Let  $f_{\varepsilon,N}(t) = |t|^{-\frac{1}{p}} \chi_{\varepsilon,N}(|t|)$ , where  $\chi_{\varepsilon,N}$  is the characteristic function of the interval  $[\varepsilon, N]$ . It can be easily seen that

(8) 
$$\lim_{\varepsilon \to 0} \lim_{N \to \infty} \frac{\|\mathcal{M}_1 f\|_p}{\|f\|_p} = \mathcal{M}_1(f_0)(1),$$

where  $f_0(t) = |t|^{-\frac{1}{p}} \in L^1_{\text{loc}}$ . An easy calculation gives that

(9) 
$$\mathcal{M}_1(f_0)(1) = \frac{p}{p-1} \frac{\gamma^{\frac{1}{p'}} + 1}{\gamma + 1},$$

where  $\gamma$  is the unique positive solution of the equation

(10) 
$$\frac{p}{p-1}\frac{\gamma^{\frac{1}{p'}}+1}{\gamma+1} = \gamma^{-\frac{1}{p}}.$$

Using (9) and (10), it is a matter of simple arithmetic to now show that  $\mathcal{M}_1(f_0)(1)$  is the unique positive root of equation (1). This completes the proof of our Theorem.

Before we conclude, we would like to make some remarks. Denote by  $x = (x_1, \ldots, x_n)$  points in  $\mathbb{R}^n$ . For a locally integrable function f on  $\mathbb{R}^n$ , define

$$(\mathcal{N}_n f)(x) = \sup_{\substack{a_1 < x_1 \\ b_1 > x_1}} \cdots \sup_{\substack{a_n < x_n \\ b_n > x_n}} \frac{1}{(b_1 - a_1) \cdots (b_n - a_n)} \int_{a_1}^{b_1} \cdots \int_{a_n}^{b_n} f(y_1, \dots, y_n) \, dy_n \cdots dy_1.$$

 $\mathcal{N}_n$  is called the "strong" maximal function on  $\mathbb{R}^n$ . Clearly  $\mathcal{N}_1 = \mathcal{M}_1$ . Observe that

$$\mathcal{N}_n \leq \mathcal{M}_1^{(1)} \circ \cdots \circ \mathcal{M}_1^{(n)}$$

where  $\mathcal{M}_1^{(j)}$  denotes the maximal operator  $\mathcal{M}_1$  applied to the  $x_j$  coordinate. This shows that the operator norm of  $\mathcal{N}_n$  on  $L^p(\mathbb{R}^n)$  is less than or equal to  $c_p^n$ . By considering the function

$$g(x) = \prod_{j=1}^{n} f_{\epsilon,N}(x_j),$$

where  $f_{\epsilon,N}$  is as above, we obtain the converse inequality. We have therefore proved the following:

**Corollary.** For  $1 , the operator norm of <math>\mathcal{N}_n : L^p(\mathbb{R}^n) \to L^p(\mathbb{R}^n)$  is  $c_p^n$ , where  $c_p$  is the unique positive solution of equation (1).

One can show that  $\frac{p}{p-1} < c_p < \frac{2p}{p-1}$ . This implies that the operator norm of  $\mathcal{N}_n$  on  $L^p(\mathbb{R}^n)$  grows exponentially with n, as  $n \to \infty$ . Next, we observe that the same is true for the uncentered maximal function  $\mathcal{M}_n$ . There are several ways to see this. One way is by considering the sequence of functions

$$h_{\epsilon,N}(x) = |x|^{-\frac{n}{p}} \chi_{\epsilon,N}(|x|).$$

Let  $U_n$  be the open unit ball in  $\mathbb{R}^n$ . For  $x \in \mathbb{R}^n$ , let  $B_x = \frac{x}{2} + \frac{|x|}{2}\overline{U_n}$ . Then  $x \in B_x$  and

(11) 
$$\left(\mathcal{M}_{n}(h_{\varepsilon,N})\right)(x) \geq \frac{1}{|B_{x}|} \int_{B_{x}} |y|^{-\frac{n}{p}} \chi_{\varepsilon,N}(|y|) \, dy = \frac{1}{|U_{n}|} \left(\frac{2}{|x|}\right)^{n} \int_{B_{x}} |y|^{-\frac{n}{p}} \chi_{\varepsilon,N}(|y|) \, dy.$$

Therefore for  $1 and for all <math>\varepsilon, N > 0$  we have

$$\frac{\|\mathcal{M}_{n}(h_{\varepsilon,N})\|_{L^{p}}}{\|h_{\varepsilon,N}\|_{L^{p}}} \geq \frac{2^{n}}{\|h_{\varepsilon,N}\|_{L^{p}}|U_{n}|} \left\{ \int_{r=0}^{+\infty} \int_{S^{n-1}} \left[ \frac{1}{r^{n}} \int_{B_{r\phi}} |y|^{-\frac{n}{p}} \chi_{\epsilon,N}(|y|) dy \right]^{p} d\phi \ r^{n} \frac{dr}{r} \right\}^{\frac{1}{p}}$$

$$(12) \qquad = \frac{2^{n}}{\|h_{\epsilon,N}\|_{L^{p}}|U_{n}|} \left\{ \int_{r=0}^{+\infty} \int_{S^{n-1}} \left[ \frac{1}{r^{n}} \int_{t=0}^{r} \int_{S_{\phi}(\frac{t}{r})} t^{-\frac{n}{p}} \chi_{\epsilon,N}(t) t^{n} \frac{dt}{t} d\theta \right]^{p} d\phi \ r^{n} \frac{dr}{r} \right\}^{\frac{1}{p}},$$

where  $S_{\phi}(t) = \{\theta \in S^{n-1} : |t\theta - \frac{\phi}{2}| \le \frac{1}{2}\}$ . By a change of variables (12) is equal to

(13) 
$$\frac{2^{n}}{\|h_{\varepsilon,N}\|_{L^{p}}|U_{n}|} \left\{ \int_{S^{n-1}} \int_{r=0}^{+\infty} \left[ \int_{t=0}^{1} \int_{S_{\phi}(t)} \chi_{\varepsilon,N}(rt) t^{\frac{n}{p'}} \frac{dt}{t} d\theta \right]^{p} \frac{dr}{r} d\phi \right\}^{\frac{1}{p}}$$
$$= \frac{2^{n}}{|U_{n}|} \left\{ \int_{S^{n-1}} \left[ \frac{\int_{r=0}^{\infty} \left| (K_{\phi} * \chi_{\varepsilon,N})(r) \right|^{p} \frac{dr}{r}}{\int_{r=0}^{\infty} \chi_{\varepsilon,N}^{p}(r) \frac{dr}{r}} \right] \frac{d\phi}{\omega_{n-1}} \right\}^{\frac{1}{p}},$$

where  $K_{\phi}(t) = t^{n/p'} \chi_{[0,1]}(t) \int_{S_{\phi}(t)} |\theta|_B^{-n/p} d\theta$ ,  $\omega_{n-1} = |S^{n-1}| = \frac{(n-1)\pi^{\frac{n-1}{2}}}{\Gamma(\frac{n+1}{2})}$ , and \* denotes convolution on the multiplicative group  $G = (\mathbb{R}^+, \frac{dt}{t})$ . If  $K \ge 0$  on G, the sequence of functions  $\chi_{\epsilon,N}$  gives equality in the convolution inequality  $||g * K||_{L^p(G)} \le ||K||_{L^1(G)} ||g||_{L^p(G)}$ as  $\varepsilon \to 0$  and  $N \to \infty$ . Therefore, the expression inside brackets in (13) converges to  $||K_{\phi}||_{L^1(G)}^p$  as  $\epsilon \to 0$  and  $N \to \infty$ , and we obtain the estimate

$$\lim_{\substack{\epsilon \to 0 \\ N \to \infty}} \frac{\|\mathcal{M}_n(h_{\varepsilon,N})\|_{L^p}}{\|h_{\varepsilon,N}\|_{L^p}} \ge \frac{2^n}{|U_n|} \left\{ \int_{S^{n-1}} \left[ \int_{0}^{1} t^{\frac{n}{p'}} \int_{S_{\phi}(t)} d\theta \, \frac{dt}{t} \right]^p \frac{d\phi}{\omega_{n-1}} \right\}^{\frac{1}{p}} = \frac{n2^n}{\omega_{n-1}} \int_{0}^{1} t^{\frac{n}{p'}} \int_{B_1 \ge t} d\theta \, \frac{dt}{t}$$

$$(14) \qquad = 2^n p' \frac{\omega_{n-2}}{\omega_{n-1}} \int_{0}^{1} s^{\frac{n}{p'}} (1-s^2)^{\frac{n-3}{2}} \, ds = 2^{n-1} p' \frac{\omega_{n-2}}{\omega_{n-1}} B(\frac{n}{2p'} - \frac{1}{2}, \frac{n-3}{2}).$$

Stirling's formula gives that expression (14) is asymptotic to  $\left\{\frac{4(\frac{1}{p'})^{\frac{1}{p'}}}{(\frac{1}{p'}+1)^{(\frac{1}{p'}+1)}}\right\}^{\frac{n}{2}}$  as  $n \to \infty$  and since the number inside the braces above is bigger than 1 when 1 , we also

deduce exponential growth for the operator norm of  $\mathcal{M}_n$  on  $L^p(\mathbb{R}^n)$ , as  $n \to \infty$ .

These remarks should be compared to the fact that for 1 , the operator norm $of the Hardy-Littlewood maximal function on <math>L^p(\mathbb{R}^n)$  is bounded above by some constant  $A_p$  independent of the dimension n (see [S] and [SS]).
